

Rewinding the classic Triad[®] HS-52 Tube to Line Output Transformer

By C. H. Preston

The Triad HS-52

Welcome to another installment of my vintage audio transformer dissection series. In this paper the very popular and sadly discontinued Triad HS-52 vacuum tube to line output transformer will be dissected and documented right down to the coilform. Like the other papers in this series, all of the techniques that were used to wind the original units are revealed in great detail. The information in this text will provide all data necessary to preform a professional rewind on these excellent transformers.

Triad is the registered name of Triad Magnetics www.triadmagnetics.com. The author has no affiliation.

I would like to thank the very generous and kind Dennis (Doc) Hoyer of autran, Audio Transformers www.roger-russell.com/autran.html for his expertise and information assistance. Without his help this paper would not have been complete.

For more transformer dissections, pro-audio products and information, or, if you would like to contact me, please visit my website: www.vintagewindings.com
